Team 15 Sprint 1 Retrospective

Roan Finkle, Luke Smith, Artem Yurovskiy, Jackson Smith, Drew Balaji, Pratik Bang

What Went Well?

In general, we built most of the major features that we wanted to for this sprint, providing proper and consistent functionality. Important components of account management and workout logging were completed thoroughly. Along with that, extra features such as accessibility features and diet searching and tagging were completed, allowing for a better overall user experience.

User Story 1

User Story #	Description
1	As a user, I will partake in an onboarding process that will consist of age, height, weight, goals, and experience

Overview: This user story orients and onboards new users with a quiz that generates useful data for our future LLM models to be prompted with, alongside recording the user's goals for our manual models.

Completed: The onboarding quiz was designed modularly to allow extremely easy modification in the future, and passed all acceptance criteria. Users are easily able to input answers to the quiz questions, users can enter any answers to reach all possible quiz branches, and users are displayed a health score. The quiz is successfully routed from the create account screen, data is sent to the server, and properly routed to the home page afterward.

User Story 2

User Story #	Description
2	As a user, I would like to be able to create and manage an account for the app, such as creating and changing a username or bio.

Completed: The user is able to update their username and bio in the settings page of the homepage, with the changes being saved properly. Along with that, the user was able to create an account with the given details, assuming that the account was not occupied by another user.

User Story 3

User Story #	Description

3	As a user, I would like to be able to reset my password.

Completed: Resetting passwords for users works successfully. Users click the reset password button and are directed to the appropriate reset password screen, where they can enter their account email and the new password they want to use to sign in. This password is then changed so the user can log in with that email and password combination, and they cannot log in with their previous password.

User Story 4

User Story #	Description
4	As a user, I would like to be able to delete my account.

Completed: After a user successfully creates a new account, they can delete it any time they want. Within the home page settings, the user can press the button to delete their account, this removes the email-username-password tuple along with any personal health-related records that were logged. Attempting to login with these removed credentials will display an error, and a different person could also use the newly available username seperately.

User Story 5/7

User Story #	Description
5	As a gym user, I would like to be able to track my workouts by logging the workout, reps, weight, and sets.
7	As a gym user, I would be able to upload and save my prior gym routines.

Completed: Users are able to log their workouts in *Forge,* being able to select an exercise that they completed, how many reps they did, and the sets and weight for that particular exercise. Once done inputting the workout that they completed, users are able to save the workout by pressing a button that allows for that workout to be logged in the database. Thus, the user is able to access the workout that they logged after completion and save it on *Forge.*

User Story 6

User Story #	Description
6	As a gym user, I would like to be able to have cardio machines suggested to me for targeted fat loss.

Overview: This user story's goal was to have an interface that allowed users to prompt the database for cardio machines with specific goals and receive results targeted for the users' goals.
Completed: This user story was successfully implemented in the form of a button that brings up a pop-up interface and displays search results after searching.

This user story, being implemented in button form, allowed for it to be plugged into any interface post-implementation just by adding the button. A UI button successfully opens the menu, the user may search for any machines in the database, and the server returns machines matching the search prompt to display properly to the user.

User Story 8/9

User Story #	Description
8	As a gym user, I would like to be able to add tags to my workouts to make them easier to find.
9	As a gym user, I would like to be able to search for different workouts based on the tags assigned to them.

The workout search is implemented well, with users being able to use tags to pull up workouts without much hassle. The search bar runs this query in the database to grab workouts that match those tags. Then the results were displayed to the user correctly. The searches were also consistently accurate based on what was searched.

User Story 10/13

User Story #	Description
10	As a gym user, I would like to be able to schedule my workouts on a calendar.
13	As a user, I would like to be able to maintain a week-by-week workout.

Completed: Users were able to schedule workouts on the specified date and selected time, which then properly showed up on the calendar. Additionally, the feature to set workouts to recur weekly functioned correctly, and users were able to select the number of weeks they wished the workout to persist, which then showed up on the calendar.

User Story 12

User Story #	Description
12	As a user, I would like to be able to easily navigate to the home, workout, diet, and social tabs through the use of a menu.

Completed: The presentation went over the navigation menu pretty well. It lets users switch between tabs like Home, Workout, Diet, and Social without much hassle. I think that part made sense right away.

The team showed off the interface design. They demonstrated how clicking each tab takes you to a separate screen. They talked about the acceptance criteria, too. And the way the tabs switched seamlessly, it just clarified the whole functionality. The user experience seemed straightforward from that. Sometimes these demos can get confusing, but this one did not.

User Story 15

User Story #	Description
15	As a user, I would like to be able to enable certain accessibility features (dark mode, large text).

Completed: Users areable to change between light and dark themes, and the app correctly inverted colors. Additionally, users are able to successfully use the slider to change the size of the in-app text to their preference.

User Story 16

User Story #	Description

16	As a dieter, I would like to be able to apply certain tags to my meals to make them easier to find.

Completed: The user was able to select various tags pertaining to meals. Each tag was highlighted to show that it was selected, and if a tag wasn't selected, the user was prompted to add the tags sequentially. Along with that, the tags were easy to understand, with names that made it easy for users to understand what they were for.

User Story 17

User Story #	Description
17	As a dieter, I would like to be able to apply certain tags to my meals to make them easier to find.

Completed: The user was able to filter by the various tags assigned to meals. Once a tag was applied, it went to a library section, and the user was able to see all of the created meals there. This was able to be filtered down to specific tags, and where applicable, no meals were shown.

What Did Not Go Well?

In general, we struggled to find time to allocate to completing some user stories. Some had code written but implementation in the app was not completed, and some were just deemed not essential for the app, and were pushed off till the end where we did not have time for completion. Along with that, the user stories with some code written were unable to be tested effectively, so it was best to leave those features out till we had more time to test.

User Story 11

User Story #	Description
11	As a dieter and athlete, I would be able to switch between imperial and metric systems to measure weights in the gym and portions in the kitchen.

Overview: This user story is concerned with allowing users to seamlessly switch between metric and imperial measurement systems (kilograms and pounds), during a workout or while cooking.

Not Completed: Since we put off, as a team, how we wanted the interface to look like when a user starts a workout, we weren't able to accordingly plan how we wanted this feature to tie in. We have partially completed this live workout tracking, and we will continue to update it as we tie in our tailored GenAI recommendations. This will allow us to finalize this measurement swap feature.

User Story 14

User Story #	Description
14	As a user, I would like to be able to select a location, so I can see gyms and people near me.

Overview: This user story aims to let users see nearby users and gyms to find gym buddies and workout locations. The nearby user system did not get implemented, as it relies on the social networking system, which is aimed to be implemented in the third sprint.

Not Completed: The nearby gym system is partially functional, but currently not able to be tested. The app is designed using React Native, and React Native's maps library does not have an embedding for web exports, so it cannot be tested in a developer's environment. However, the app can be run on an emulator. The only problem is that since the emulator is virtual, it does not have a location, and thus opening the map system simply displays the handled case of "No

location access". While this confirms that our implementation for catching the user denying location access is functional, it doesn't allow us to test the nearby gym finding system.

This means we meet the acceptance criteria for display pop-ups and "No location access", but fail the acceptance criteria for seeing nearby users and pinned gyms on an embedded map. If we could load it onto a real device, it would work in theory, but at the moment, it cannot be tested.

User Story 15

User Story #	Description
15	As a user, I would like to be able to enable certain accessibility features (dark mode, large text).

Overview: This user story aimed to implement accessibility settings common among many mobile apps, including changing from light mode to dark mode, where the app background changes from white to black and text color changes from black to white, and text size, where users can increase the size of the text.

Not Completed: The accessibility features (dark mode, large text) worked, but one of the acceptance criteria included the app saving the user's preferred accessibility setting between loads. We did not get this to but we will complete this in Sprint 2 by saving the user's accessibility selections in the database and then retrieving this data on app startup.

User Story 18

User Story #	Description
18	As a dieter, I would be able to view the nutritional facts of different meals from national restaurants.

Overview: This user story strives to allow users to search for possible meals at national chain restaurants that meet their criteria, typically being used when they don't feel like cooking at home.

Not Completed: The majority of the work is done. We ingested 7 restaurants into csv format, created a data pipeline to combine similar nutritionally valued columns and derive features for selection, all into a deployable format. However, pressing the UI button indicates an error and warrants further debugging, probably with front-to-back routes or relational database ingestion; we did not have enough time to finalize this for our presentation.

User Story 19

User Story #	Description
19	As a user, I will be able to bypass manually inputting username and password during login with a Remember Me feature.

Overview: This user story aims to boost app functionality for the user by allowing them to bypass the login screen.

Not Completed: The hash functions and server logic were implemented pretty early on, and we did not make the button until the standard login interface was complete. There was not enough time between finishing the standard login screen, adding the remember me button, and the presentation, so we weren't able to debug and ensure proper effectiveness.

User Story 20

User Story #	Description
20	As a user, I would like to be able to read and agree to the Terms and Conditions of the service.

Overview: This user story aimed to have a functional Terms and Conditions page for users creating their accounts, in which they can agree before using the app.

Not Completed: This user story went completely untouched. This story was added to supplement hours for people lacking hours this sprint; however, this caused the story to be split across several group members. This split and also late addition caused it to go untouched and forgotten, especially due to the low group meeting frequency. The user story simply fizzled out in the background and went completely unimplemented.

User Story 21

User Story #	Description
21	As a user, I would like to get notifications (through email) for any updates.

Not Completed: Although the email notification system was fully implemented in the backend, it could not be demonstrated during the presentation because the SMTP configuration was not set up in time. As a result, we were unable to show the emails being sent live. However, the backend logic for triggering notifications when creating an account, changing a password, and adding a workout was completed and functioning correctly.

How Should We Improve?

Frequent communication and check-ins

An issue that we had as a group was insufficient communication in the earlier parts of a sprint. Generally, we would make sure everything was on for meetings, but usually not every group member could be present, and not everything was properly communicated for members who were unable to be at the meeting. Also, group members were not held accountable for their specific parts and were trusted to finish it on their own, whether they had time for it or not. Checking in as a group on our progress and communicating where we are with the project will allow for a more consistent progression in development. If one member has an issue, assistance will be easier, and we will be able to ensure that we are all on the same page more often, compared to what we were this sprint.

Integration more frequently and before the 11th hour

As a group, we found ourselves scrambling at the last minute to get the project integrated and functional. While each user story was tested locally, it wasn't all brought together until the day before the presentation. That's why in order to make sure that Sprint 2 is smoother, we are designating time at the end of each week to bring our work together and ensure that the app functions are promised. This will also help us to benchmark our progress and course correct when needed.

Overall, we need to work harder to ensure that we have time to get to every user story that we can and implement it properly in our app. Making sure that we have time to implement logic, UI, and testing for each story will allow us to see more progress and have a much greater end product to present at the end of our three sprints. Although all members have made incredible individual efforts to get the project running and have their features work effectively, working as a better team will allow us to learn more and be much happier with what we have made at the end, because it will be an overall better product.
